

DAE δ ALUS

A Path to Measuring δ_{CP} Using Cyclotron
Decay-at-Rest Neutrino Sources

Snowmass 2013
Matt Toups, MIT

$\overleftarrow{\nu}_\mu \rightarrow \overleftarrow{\nu}_e$ Oscillations at $2\pi E/L \sim |\Delta m_{13}^2|$

Are Sensitive to δ_{CP}

in a vacuum...

$$P = (\sin^2 \theta_{23} \sin^2 2\theta_{13}) (\sin^2 \Delta_{31})$$
$$\mp \underline{\sin \delta} (\sin 2\theta_{13} \sin 2\theta_{23} \sin 2\theta_{12}) (\sin^2 \Delta_{31} \sin \Delta_{21})$$
$$+ \underline{\cos \delta} (\sin 2\theta_{13} \sin 2\theta_{23} \sin 2\theta_{12}) (\sin \Delta_{31} \cos \Delta_{31} \sin \Delta_{21})$$
$$+ (\cos^2 \theta_{23} \sin^2 2\theta_{12}) (\sin^2 \Delta_{21}).$$

We want to see
if δ is nonzero

[Engineering Study of Sector Magnet for the Daedalus Experiment](#)

[Joseph Minervini](#), [Mike Cheadle](#), [Val Fishman](#), [Craig Miller](#), [Alexi Radovinsky](#), [Brad Smith](#)

(Submitted on 21 Sep 2012)

The Daedalus experiment seeks to evaluate neutrino scattering effects that go beyond the standard model. Modular accelerators are employed to produce 800 MeV proton beams at the megawatt power level directed toward a target, producing neutrinos. The Superconducting Ring Cyclotron (SRC) consists of identical sectors (currently 6) of superconducting dipole magnets with iron return frames. The Daedalus Collaboration picked a conceptual design for the SRC, which uses several magnet sectors to make the most best design that achieves the physics requirements of the experiment. The Technology and Engineering Division (T&E) of the MIT Plasma Science and Fusion Center was awarded with a contract by the Daedalus team to further develop the magnet conceptual design. The resulting Engineering Study is reported here.

Winner of the 2013 IEEE Council on Superconductivity Award!

Table 5: Comparison of main parameters for DSRC with those for RIKEN-SRC

Basic Parameters	DSRC	RIKEN-SRC	Unit
Maximum field on the hill	6.05	3.8	T
Maximum field on the coil	6.18	4.2	T
Stored Energy	280	235	MJ
Coil size	30× 24 or 15× 48	21× 28	cm ²
Coil Circumference	9.8	10.86	m
Magnetomotive force	4.9	4	MAtot/sector
Current density	34	34	A/mm ²
Height	5.6	6.0	m
Length	6.9	7.2	m
Weight	≤450	800	ton
Additional magnetic shield	0	3000	ton/total
Magnetic Forces

Five Years of Running at KamLAND

Inverse β Decay (IBD)

Accelerator	60 MeV/amu of H_2^+
Current	10 mA of protons on target
Power	600 kW
Duty cycle	90%
Run period	5 years (4.5 years live time)
Target	^{9}Be surrounded by ^{7}Li (99.99%)
$\bar{\nu}$ source	^{8}Li β decay ($\langle E_\nu \rangle = 6.4$ MeV)
$\bar{\nu}_e/1000$ protons	14.6
$\bar{\nu}_e$ flux	$1.29 \times 10^{23} \bar{\nu}_e$
Detector	KamLAND
Fiducial mass	897 tons
Target face to detector center	16 m
Detection efficiency	92%
Vertex resolution	$12 \text{ cm}/\sqrt{E} \text{ (MeV)}$
Energy resolution	$6.4\%/\sqrt{E} \text{ (MeV)}$
Prompt energy threshold	3 MeV
IBD event total	8.2×10^5
$\bar{\nu}_e$ -electron event total	7200

820,000 IBD events
 ➤ Sterile neutrino search

7,200 $\bar{\nu}_e$ -electron events
 ➤ Measure $\sin^2\theta_W$ to 3.2%
 ➤ Probe weak couplings and nonstandard interactions (NSIs)

SYNOPSIS

Particle accelerator systems have been key drivers for a broad array of fundamental discoveries and transformational scientific advances since the early 20th century. Since their inception, they have also been core components of U.S. technological innovation and economic competitiveness.

The Accelerator Science program will support and foster research at universities that exploits the educational and discovery potential of basic accelerator physics research, and allows the development of transformational discoveries in this crosscutting academic discipline. In particular, this program seeks to support research with the potential to disrupt existing paradigms and advance accelerator science at a fundamental level, such as enabling discoveries that lead to novel, compact, powerful, and/or cost-effective accelerators. Key questions that this program will address include: what are the fundamental limitations affecting the acceleration, control, intensity, and quality of particle beams? What novel approaches can be employed to substantially increase accelerating gradients? How can developments in other fields lead to new approaches in accelerator science and beam physics?

The goal of this program is to seed and support fundamental accelerator science at universities as an academic discipline, providing the foundation in knowledge and workforce upon which major advances in accelerator-driven technologies will be based. An important component of the program will be the support and training of the next generation of accelerator scientists, including students, postdoctoral researchers, and junior faculty, who will lead innovations in the field and will form the backbone of the
